

Authentication Services

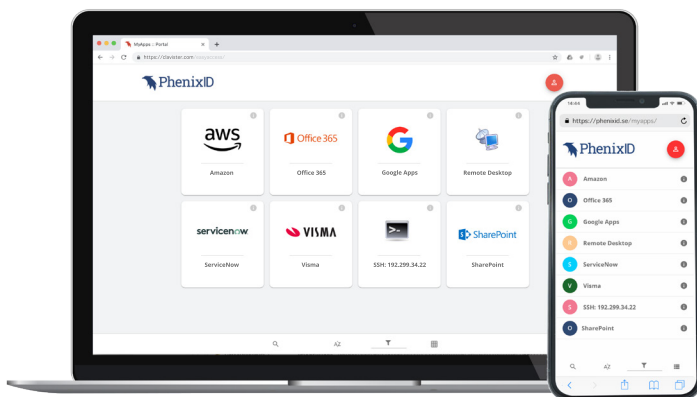

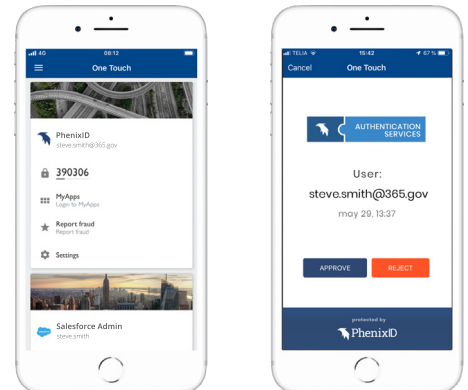

Strong authentication and single sign-on

PhenixID Authentication Services (PAS) enables organizations to implement strong authentication, single sign-on for web and mobile applications regardless of where the user is located or what device they are using.

One Touch

One Touch delivers two-factor push notifications to your phone for fast and secure access. Use One Touch to approve/deny request for authentication or digital signing. Protect the certificate based profile using pin code or built-in biometrics. Self service enrollment is included so users can activate One Touch quick and easy.

My Apps

With MyApps users can easily access their application both using secure login as well as single sign-on. Application will be made available based on digital identity criteria i.e. member of group, specific attribute, IP/geolocation. With step-up authentication, user can be challenged to produce additional forms of authentication when for example accessing high-risk resources.

Multi-factor authentication

Choose between several authentication methods and provide easy access when users login on-premise or to the cloud. Self enrolment portal for rapid activation.

Onboarding

With PAS, the onboarding process will be both secure and easy using self-service portal or delegated administration with securely verified identities.

Integrate your world

By integrating both your existing services and applications together with your existing authentication methods, PAS will act as the central hub for secure identity verification throughout your organisation.

Single Sign-On

PAS supports protocols, such as SAML 2.0, OAuth, OpenID Connect and ADFS 2019, to integrate different types of application to support SSO. Solution also includes different ID-mapping scenarios.

Verify User

Verify User adds an extra security layer so that service desk personnel can have a higher trust that they are talking to a legitimate dialed in user.

Infrastructure as code (IaC)

Manage PAS in your IT infrastructure using configuration files and quickly spin up new instances with the exact same configuration. With the IaC support, you can easily move PAS installations between test and production environment.

WHY

PhenixID are **passionate** to assist organisations to achieve **trust** in their digital identities. We value **integrity** and **expertise** by being honest in our delivery of **quality applications**.

HOW

PhenixID are **customer driven** and our focus is on **understanding** your challenges. Thanks to our customers **participation** we are able to deliver **flexible** solutions that are both **effective** and **solid**.

WHAT

We deliver **security through identity** on an extensible platform that meet the need for constant change that our customers are facing. With our long **experience**, we can **safely deliver value** both in the short and long term.
